RE: Big Rivers Electric Corporation's Sebree Station annual CCR fugitive dust control report 257.80 air criteria (7)(c)

Per 40 C.F.R. §257.80 (7) (c) an annual fugitive dust control report must be created in response to how the fugitive dust control plan was utilized in the past year. The plan went into effect on October 19, 2015, and was placed on the publically accessible website. Since that time, no citizen complaints have been filed with Big Rivers Electric Corporation. In order to control the fugitive dust Big Rivers Electric Corporation has continued with the following preventative measures over the past year:

- Fugitive dust was suppressed through the use of a water truck at the facility, weather permitting. Chemical dust suppressant was also applied on a limited basis.
- Crushed stone was applied to repair road surfaces as necessary on facility premises. An additional benefit was that it helped with fugitive dust suppression in these areas.

The water trucks were operated year round as the temperature allowed. No corrective measures are needed at this time.
